## Product data

### ► KaClima R32 AO 4–16 kW

#### Product benefits

- ▶ R32 refrigerant to reduce the greenhouse effect by approx. 75%
- ▶ noise-reduced operation possible for night-time hours
- ▶ continuously variable EC fans
- ▶ integrated circulation pump, safety valve, flow monitor and dirt trap
- ▶ ultra-space-saving arrangement of the components
- ▶ energy efficiency class A+++<sup>6)</sup>

#### Features

##### Standard range

- ▶ 10 model sizes
- ▶ low starting currents
- ▶ leaving water temperature control
- ▶ integrated Modbus interface
- ▶ electronic expansion valve for optimum overheating control
- ▶ separate external control unit
- ▶ up to 16 units can be combined as a master/slave configuration

##### Installation

- location** ▶ outdoors
- Cooling** ▶ CHW
- Heating** ▶ LPHW
- Refrigerant** ▶ R32

##### Inverter compressor

- ▶ control range 40–100 %

##### Axial fans

- ▶ in DC version

##### Hydraulics:

- ▶ energy-saving, speed-controlled circulation pump
- ▶ separate dirt trap
- ▶ 3 bar safety valve
- ▶ integrated expansion vessel  
models 21–31: 2-litre  
models 51–81: 5-litre

#### Performance data

##### Cooling output<sup>1)</sup>

- ▶ 4.9–29.5 kW

##### Performance rating<sup>1)</sup>

- ▶ ESEER 4.54–4.99

##### Heat output<sup>3)</sup>

- ▶ 4.8–30.0 kW

##### Performance rating<sup>2)3)</sup>

- ▶ COP 2.9–4.0

##### Sound pressure level<sup>4)</sup>

- ▶ 49–62 [dB(A)]

##### Sound pressure level

##### Noise-reduced operation<sup>4,7)</sup>

- ▶ 46–54 [dB(A)]

##### Limits of cooling mode

- ▶ min. outside temperature: -5°C<sup>5)</sup>
- ▶ max. outside temperature: +43°C
- ▶ min. leaving water temperature: +5°C
- ▶ max. leaving water temperature: +20°C
- ▶ min. flow temperature below 15°C  
outside temperature is 10°C<sup>5)</sup>

##### Limits of heating mode

- ▶ min. outside temperature: -25°C
- ▶ max. outside temperature: +35°C
- ▶ min. leaving water temperature: +30°C
- ▶ max. leaving water temperature: +55°C
- ▶ max. flow temperature below -15°C  
is 40°C

#### Applications

To supply centralised and decentralised water-based units with heating and cooling energy.

## Additional technical information

### Water / outside temperature limits

### Electrical wiring

The unit must be fused in accordance with the currently applicable standards and legislation!  
 Provide anti-surge fuses!  
 Provide universal residual current circuit-breakers!

230 V-energised!

\*1) Lay shielded cables (e.g. JY(ST)Y, 0.8 mm) separately from high-voltage cables. Max. cable length 50 metres.  
 \*2) Take into account voltage drop when sizing cables.

# KaClima R32 AO 4-30 kW

## ▶ KaClima R32 AO 22–55 kW

### Product benefits

- ▶ R32 refrigerant to reduce the greenhouse effect by approx. 75%
- ▶ noise-reduced operation possible for night-time hours
- ▶ continuously variable EC fans
- ▶ integrated safety valve, flow monitor and dirt trap
- ▶ optionally with integrated pump and series tank
- ▶ energy efficiency class A++<sup>6)</sup>

### Features

#### Standard range

- ▶ 6 model sizes
- ▶ low starting currents
- ▶ leaving water temperature control
- ▶ integrated Modbus interface
- ▶ electronic expansion valve for optimum overheating control
- ▶ separate external control unit
- ▶ up to 16 units can be combined as a master/slave configuration

#### Installation

- location** ▶ outdoors
- Cooling** ▶ CHW
- Heating** ▶ LPHW
- Refrigerant** ▶ R32

#### Inverter compressor

- ▶ control range 30–100%

#### Axial fans

- ▶ in DC version

#### Hydraulics:

- ▶ optional speed-controlled circulation pump
- ▶ separate dirt trap
- ▶ 6 bar safety valve
- ▶ optional integrated series tank  
models 101–141: 140 litres  
models 162–222: 180-litre

### Performance data

#### Cooling output<sup>1)</sup>

- ▶ 22.3–55.0 kW

#### Performance rating<sup>1)</sup>

- ▶ SEER 3.99–4.64

#### Heat output<sup>3)</sup>

- ▶ 24.3–62.0 kW

#### Performance rating<sup>2)3)</sup>

- ▶ COP 3.1–3.32

#### Sound pressure level<sup>4)</sup>

- ▶ 59–70 [dB(A)]

#### Sound pressure level

#### Noise-reduced operation<sup>4,7)</sup>

- ▶ 56–68 [dB(A)]

#### Limits of cooling mode

- ▶ min. outside temperature: -10°C<sup>5)</sup>
- ▶ max. outside temperature: +48°C
- ▶ min. leaving water temperature: +5°C
- ▶ max. leaving water temperature: +20°C
- ▶ min. flow temperature below 15°C  
outside temperature is 10°C<sup>5)</sup>

#### Limits of heating mode

- ▶ min. outside temperature: -14°C
- ▶ max. outside temperature: +30°C
- ▶ min. leaving water temperature: +30°C
- ▶ max. leaving water temperature: +50°C
- ▶ max. flow temperature below -5°C  
is 45°C

### Applications

To supply centralised and decentralised water-based units with heating and cooling energy.

## Product data

### ▶ KaClima R32 AO 53–85 kW

#### Product benefits

- ▶ R32 refrigerant to reduce the greenhouse effect by approx. 75%
- ▶ noise-reduced operation possible for night-time hours
- ▶ continuously variable EC fans
- ▶ integrated safety valve, flow monitor and dirt trap
- ▶ optionally with integrated pump and series tank
- ▶ energy efficiency class A++<sup>6)</sup>

#### Features

##### Standard range

- ▶ 5 model sizes
- ▶ low starting currents
- ▶ leaving water temperature control
- ▶ integrated Modbus interface
- ▶ electronic expansion valve for optimum overheating control
- ▶ separate external control unit
- ▶ up to 16 units can be combined as a master/slave configuration

##### Installation

- location** ▶ outdoors
- Cooling** ▶ CHW
- Heating** ▶ LPHW
- Refrigerant** ▶ R32

##### Inverter compressor

- ▶ control range 30–100%

##### Axial fans

- ▶ in DC version

##### Hydraulics:

- ▶ optional speed-controlled circulation pump
- ▶ separate dirt trap
- ▶ 6 bar safety valve
- ▶ optional integrated series tank  
models 101–141: 140 litres  
models 162–222: 180-litre

#### Performance data

##### Cooling output<sup>1)</sup>

- ▶ 53.3–85.0 kW

##### Performance rating<sup>1)</sup>

- ▶ SEER 4.57–4.5

##### Heat output<sup>3)</sup>

- ▶ 53.0–91.0 kW

##### Performance rating<sup>2)3)</sup>

- ▶ COP 3.21–3.25

##### Sound pressure level<sup>4)</sup>

- ▶ 67–68 [dB(A)]

##### Sound pressure level

##### Noise-reduced operation<sup>4,7)</sup>

- ▶ 54–56 [dB(A)]

##### Limits of cooling mode

- ▶ min. outside temperature: -10°C<sup>5)</sup>
- ▶ max. outside temperature: +48°C
- ▶ min. leaving water temperature: +5°C
- ▶ max. leaving water temperature: +20°C
- ▶ min. flow temperature below 10°C  
outside temperature is 10°C<sup>5)</sup>

##### Limits of heating mode

- ▶ min. outside temperature: -15°C
- ▶ max. outside temperature: +30°C
- ▶ min. leaving water temperature: +30°C
- ▶ max. leaving water temperature: +50°C
- ▶ max. flow temperature below -5°C  
is 45°C

#### Applications

To supply centralised and decentralised water-based units with heating and cooling energy.

## Description

### Frost protection:

Fill the primary circuit with anti-freeze to protect the KaClima unit from frost damage in winter. Please refer to the glycol manufacturers' data sheets for information on the concentration, properties and safety measures (e.g. collecting trays) required with the use of glycol.

### 7) Expansion vessel:

The expansion vessel needs to be sized for the filling volume of the system and possible temperature differences.

### C+8) Safety valve:

Check whether the KaClima series and option selected include a safety valve and match the discharge pressure of the entire system.

### 9) Increased ext. water volume/tank

A minimum water volume is needed in the system to ensure proper operation and maximum energy efficiency. The volume differs depending on the size and is stated in the technical data. A series tank can also be integrated as an accessory with certain KaClima units.

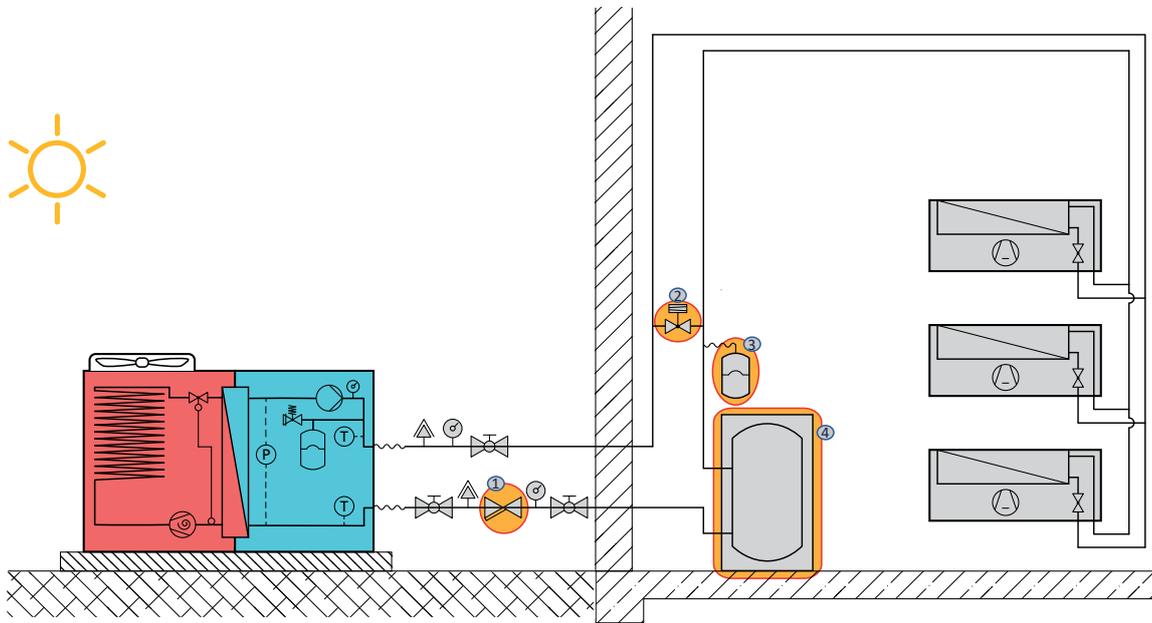

### 10) Dirt trap

The dirt trap is supplied with the KaClima and needs to be fitted directly upstream of the KaClima.

### B) Primary pump

A pump is included with the KaClima depending on the model and accessories selected. Check this against the flow and pressure loss required.

## Hydraulic circuit

**It is essential that the following points are noted when setting up chilled water or heat pump networks:**

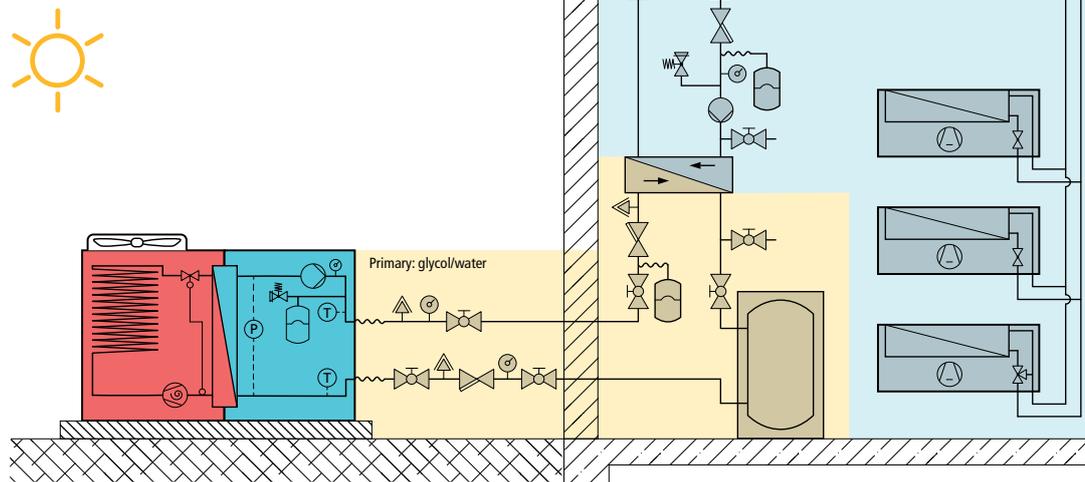

1. Fit a dirt trap upstream of all plate heat exchangers (e.g. upstream of the chiller/heat pump, system separator).
2. The chiller needs to guarantee a constant water flow. This can be done, for instance, using an overflow valve, as shown in the diagram, using a system separator or hydraulic switches.

3. Expansion vessels need to be designed for the volume of the system.
4. The water volume in the entire system needs to be sufficient to prevent the generator from clogging. The minimum water content can also be taken from the table in the technical data.

**The generator needs to be protected against frost by glycol (minimum 35%).**

### Primary/secondary separation

Primary/secondary separation can be ensured, among other things, by a plate heat exchanger. The glycol filling can therefore be reduced to the primary circuit.

## Hydraulic box

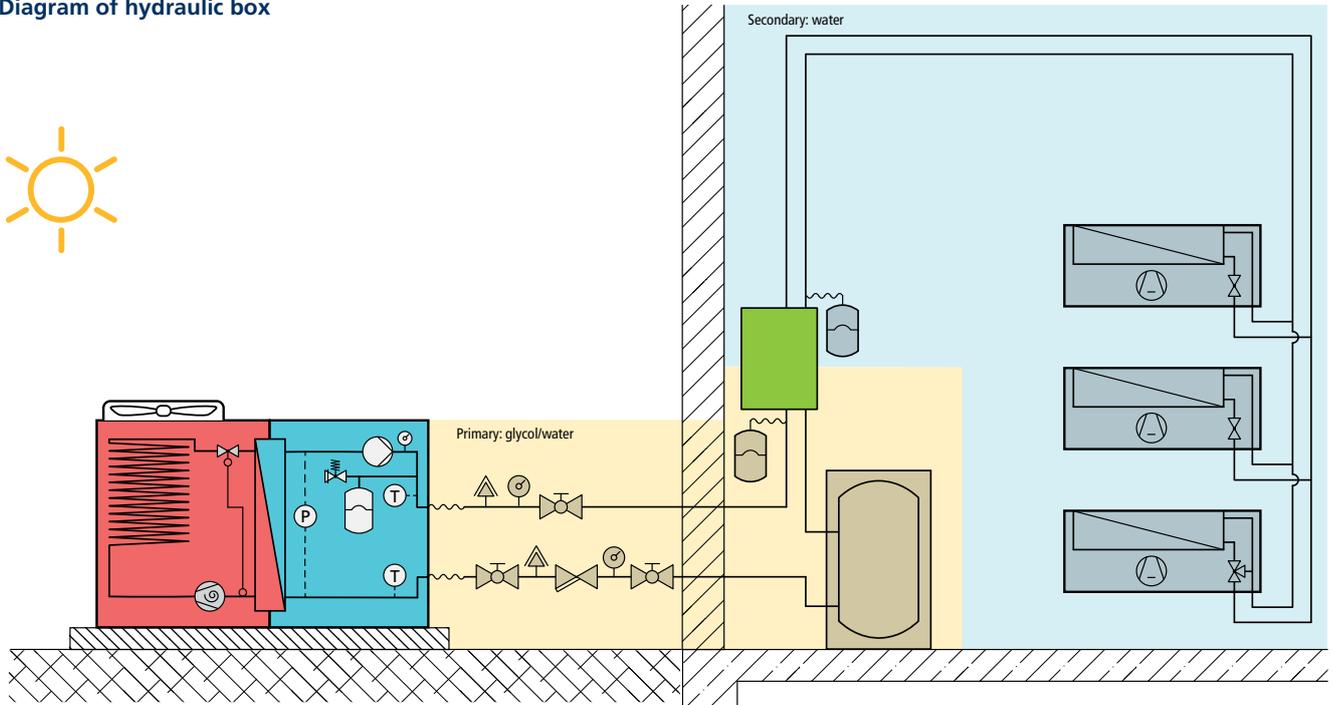

The construction of the primary/secondary system using a separator is relatively complex and time-consuming due to the many different components and the need to insulate the components. The Kampmann hydraulic box simplifies this significantly. It includes the key components and its housing protects them from condensation water:

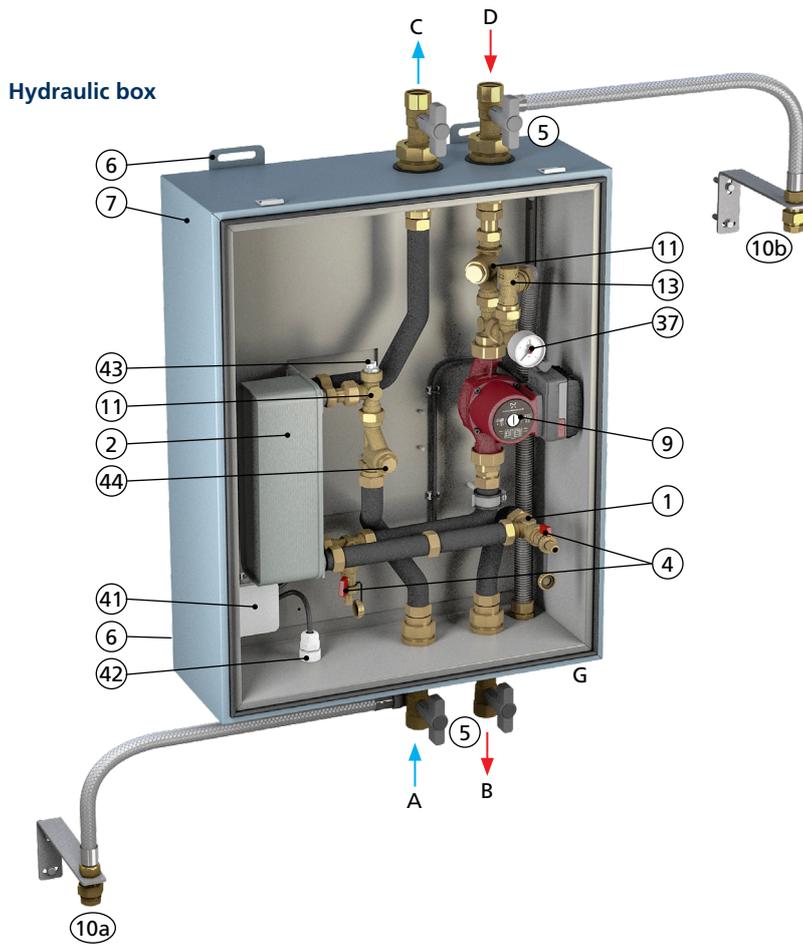

- ▶ three sizes 12/20/35 kW
- ▶ several outputs are possible by the combination of components, accessories needed

- ▶ vapour diffusion-tight insulated, impact-resistant housing
- ▶ speed-controlled, energy-saving circulation pump
- ▶ minimised sources of errors
- ▶ shortened installation times

Expansion vessels need to be sized and provided on site. External shut-off valves and corrugated hoses need to be insulated on site.

### Diagram of hydraulic box

No.	Components	Comment
1	Adapter 1" male x 130 mm for compact heating/cooling meter	For optional cooling meter (also possible with Mbus)
2	Stainless steel plate heat exchanger	
4	Fill-and-drain valve	1/2"
5	Shut-off ball valves	
6	Wall-mounted suspension lugs	
7	Insulated hybrid housing	
9	Secondary circuit pump	GF UPMXL 25-105 180 AUTO, grey cast iron
10a	Connection option for expansion vessel	3/4" male service coupling

	Return temperature	°C	14		16	
Primary	Flow temperature	°C	6	7	6	7
	Return temperature	°C	11.7	11.5	14.8	14.6
	Output	kW	35.0	35.0	34.9	34.9

Dimensions: 880 x 650 x 340 mm plus external shut-off valves

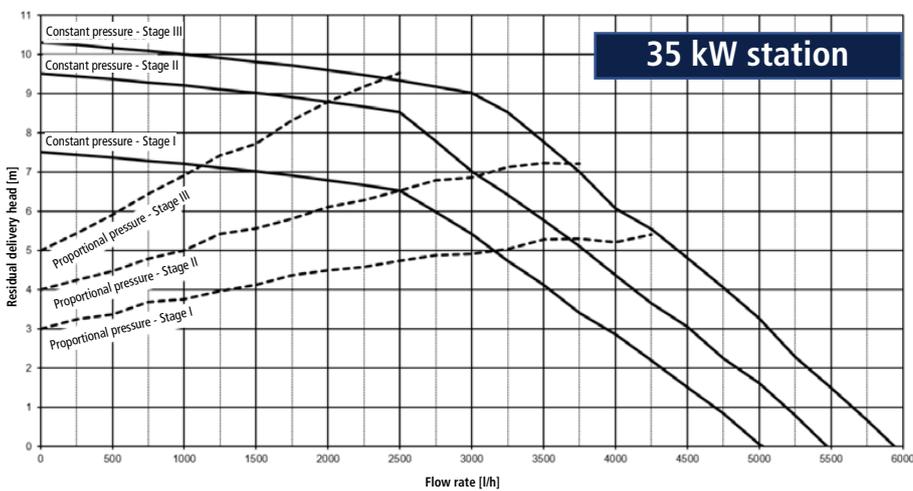

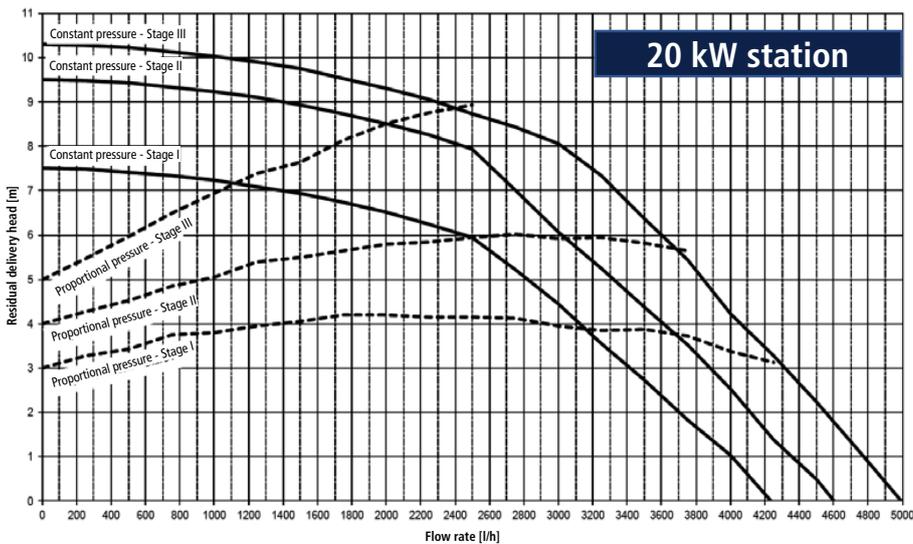

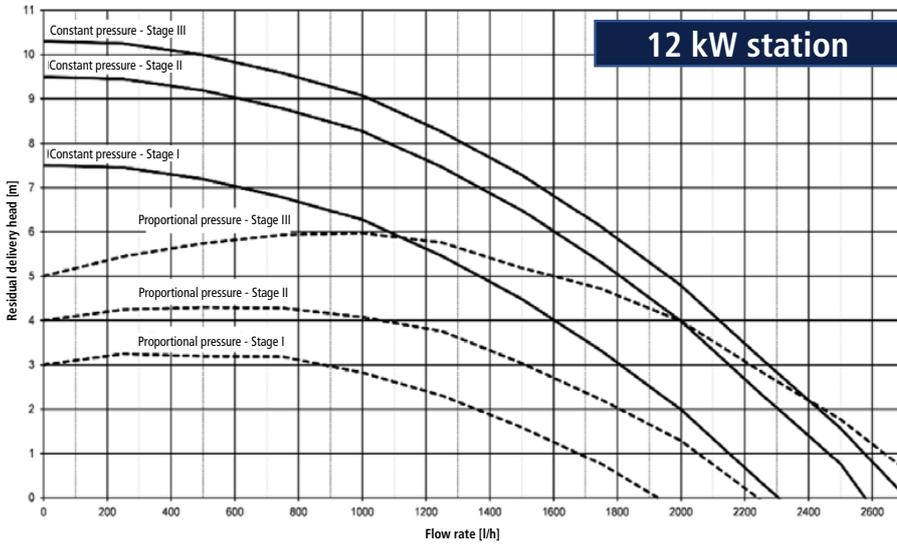

# Hydraulic box, cascading

## Combination of multiple hydraulic boxes

Higher outputs can be obtained by combining several hydraulic boxes. To do so, each hydraulic box needs to be calibrated using a volumetric flow controller, which is optionally available.

# Hydraulic box pump residual delivery heads

# 05 ▶ Hydraulic suggestions

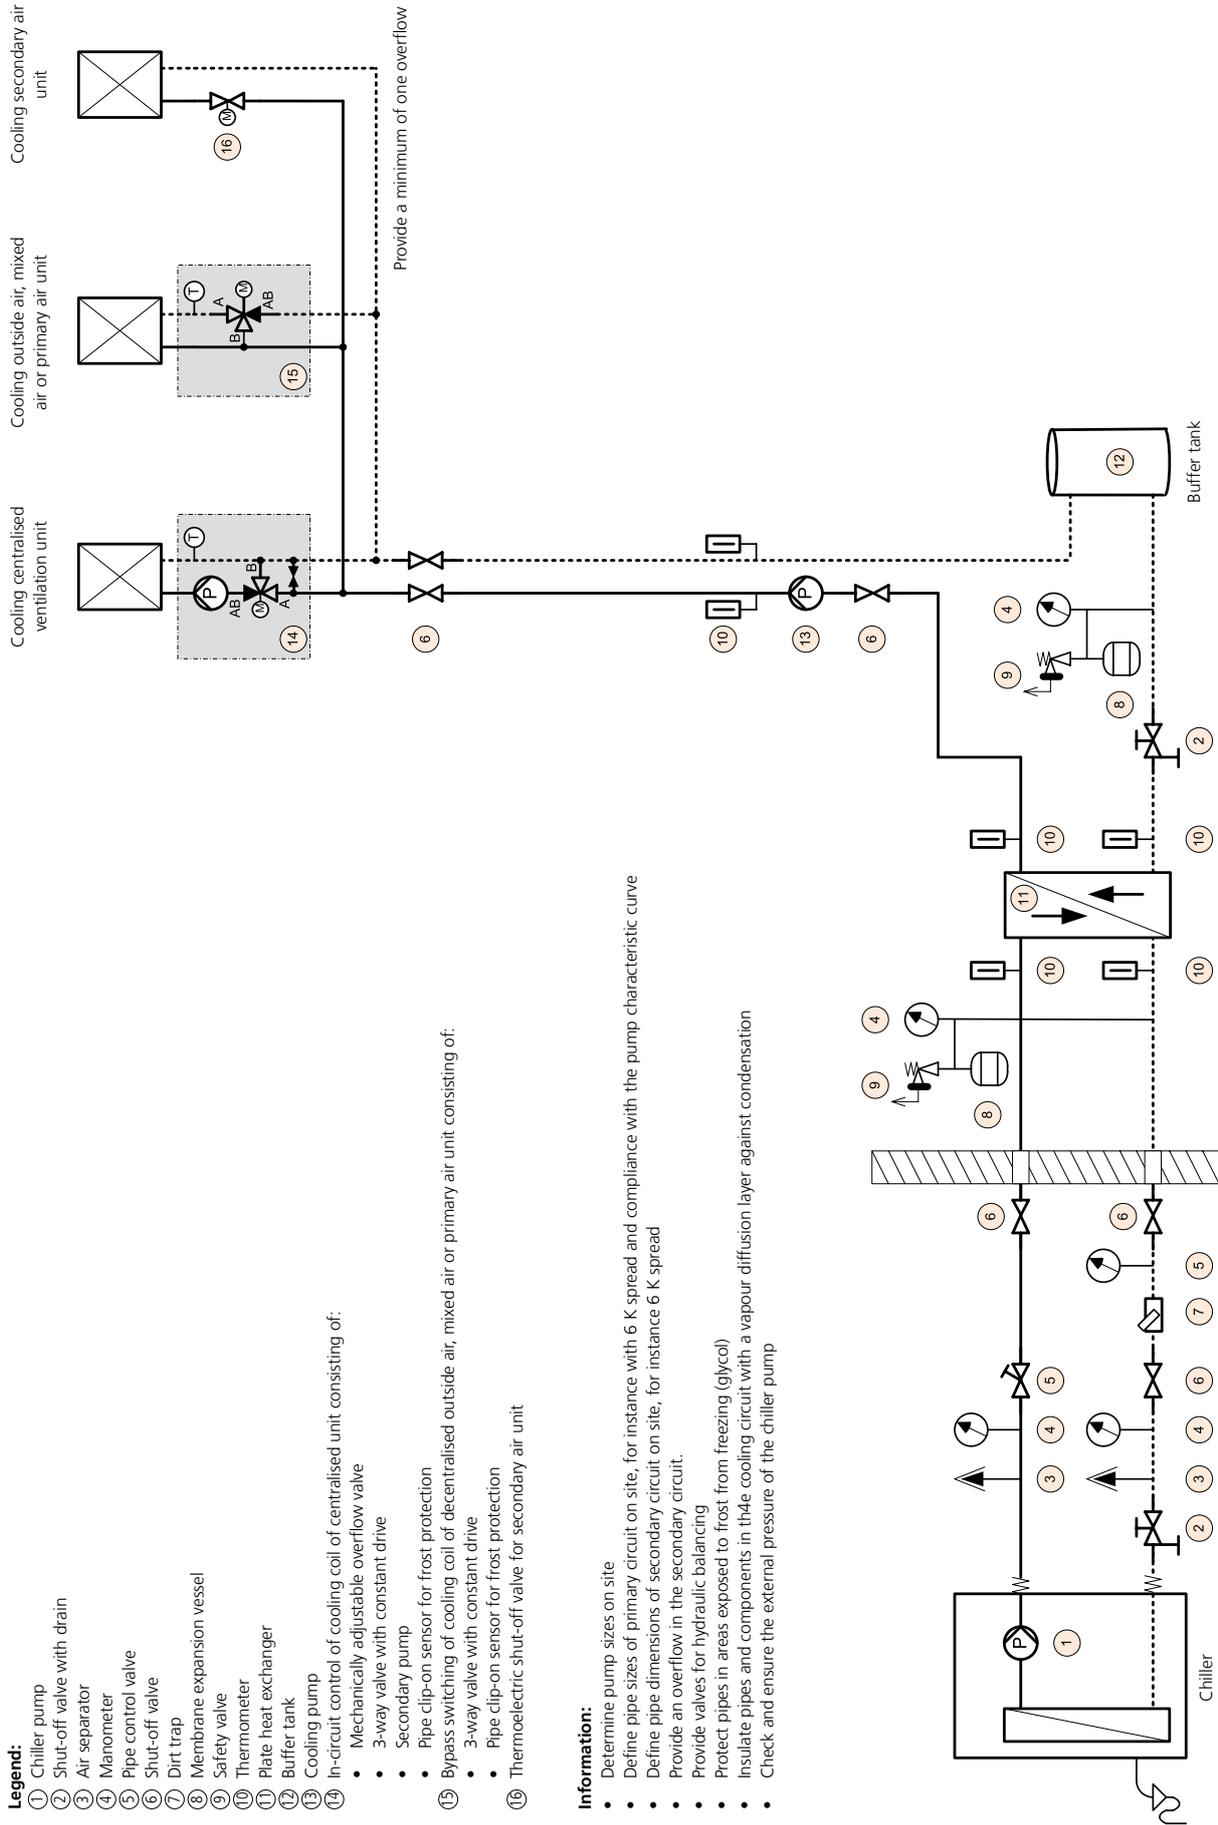

## Hydraulic system 2: 2-pipe, cooling only

### Legend:

- ① Chiller pump
- ② Shut-off valve with drain
- ③ Air separator
- ④ Manometer
- ⑤ Pipe control valve
- ⑥ Shut-off valve
- ⑦ Dirt trap
- ⑧ Membrane expansion vessel
- ⑨ Safety valve
- ⑩ Thermometer
- ⑪ Plate heat exchanger
- ⑫ Buffer tank
- ⑬ Cooling pump
- ⑭ In-circuit control of cooling coil of centralised unit consisting of:
  - Mechanically adjustable overflow valve
  - 3-way valve with constant drive
  - Secondary pump
  - Pipe clip-on sensor for frost protection
- ⑮ Bypass switching of cooling coil of decentralised outside air, mixed air or primary air unit consisting of:
  - 3-way valve with constant drive
  - Pipe clip-on sensor for frost protection
  - Thermoelectric shut-off valve for secondary air unit

### Information:

- Determine pump sizes on site
- Define pipe sizes of primary circuit on site, for instance with 6 K spread and compliance with the pump characteristic curve
- Define pipe dimensions of secondary circuit on site, for instance 6 K spread
- Provide an overflow in the secondary circuit.
- Provide valves for hydraulic balancing
- Protect pipes in areas exposed to frost from freezing (glycol)
- Insulate pipes and components in the cooling circuit with a vapour diffusion layer against condensation
- Check and ensure the external pressure of the chiller pump

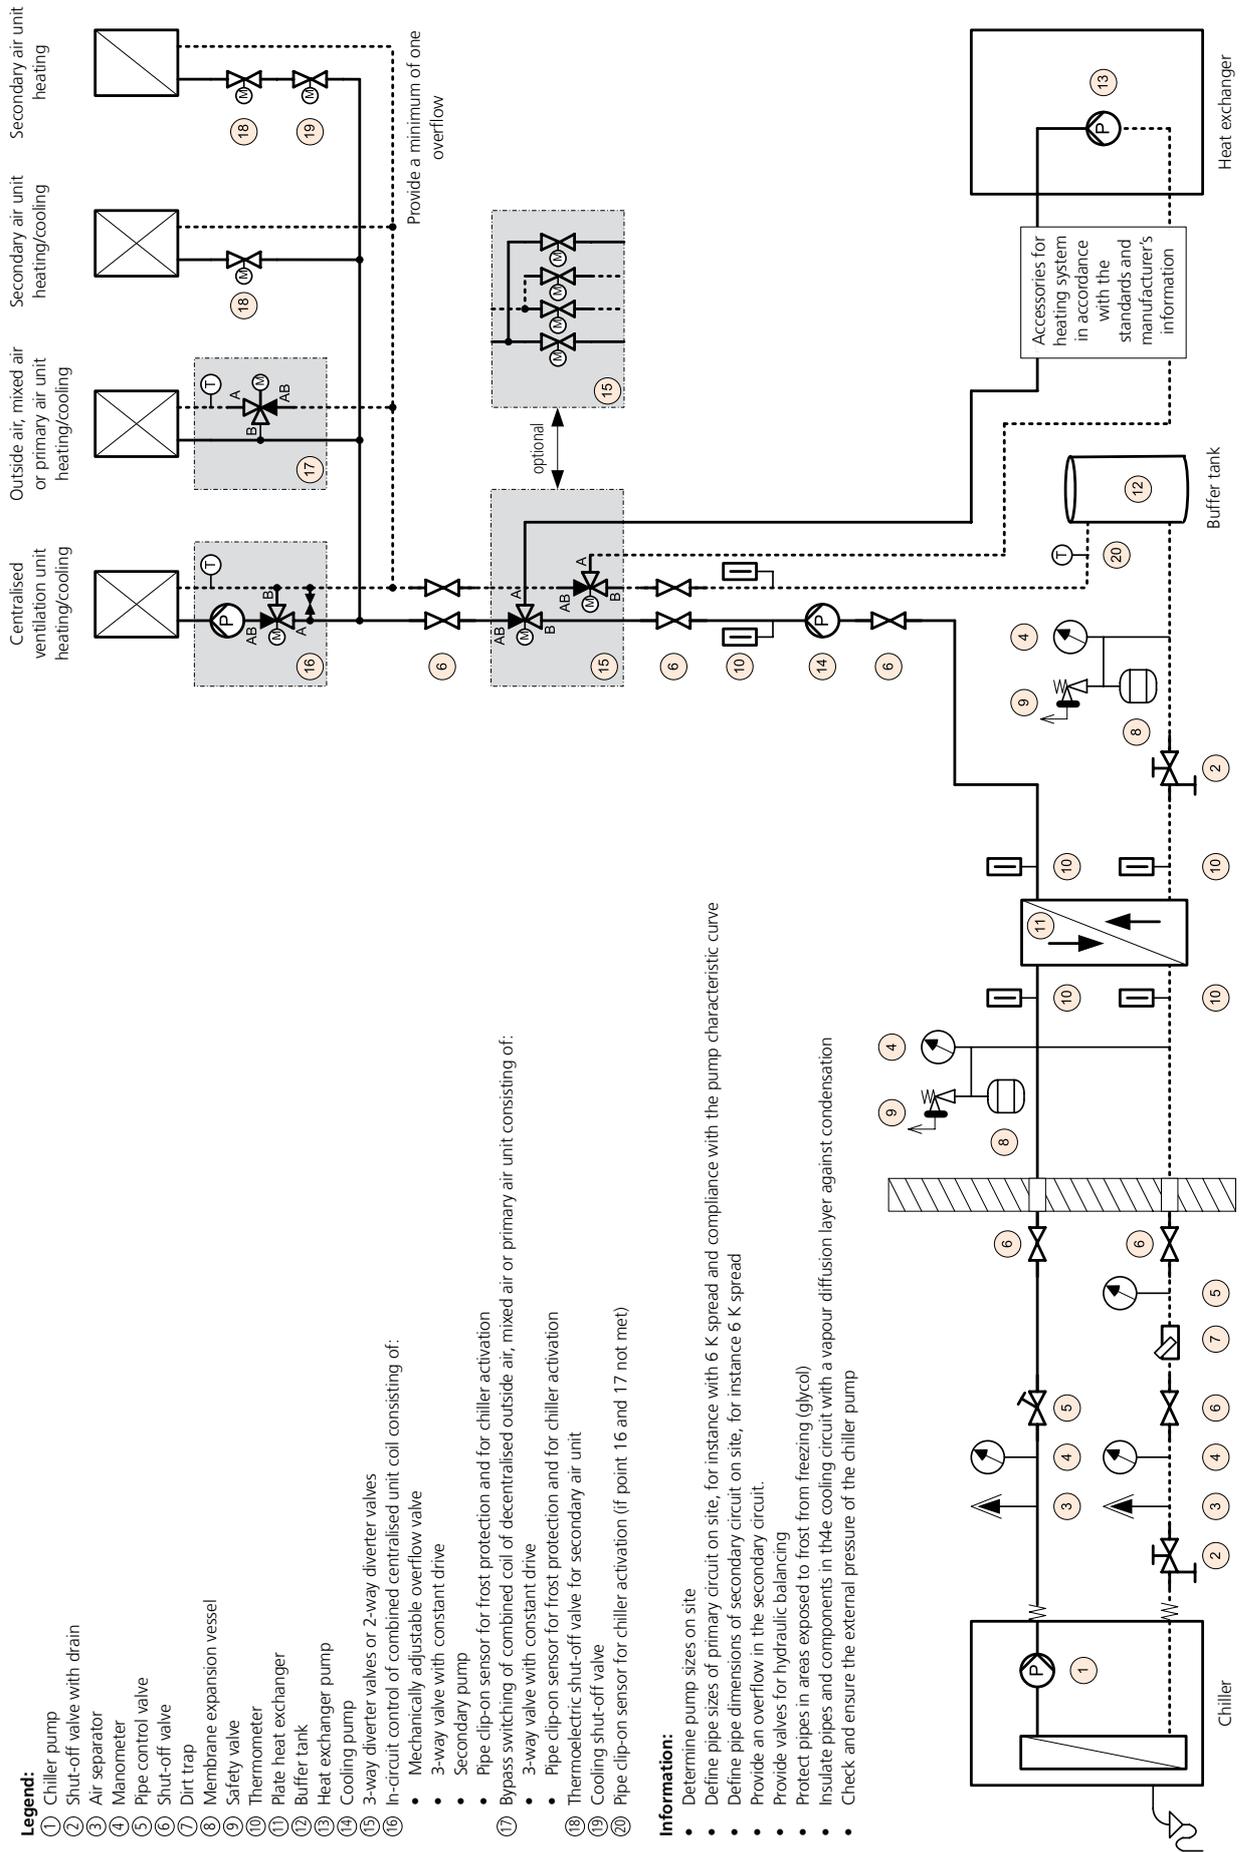

# Hydraulic system 3: 2-pipe, heating/cooling, separate energy generator

  - Secondary pump
  - Pipe clip-on sensor for frost protection and for chiller activation
- ⑰ Bypass switching of combined coil of decentralised outside air, mixed air or primary air unit consisting of:
  - 3-way valve with constant drive
  - Pipe clip-on sensor for frost protection and for chiller activation
- ⑱ Thermoelectric shut-off valve for secondary air unit
- ⑲ Cooling shut-off valve
- ⑳ Pipe clip-on sensor for chiller activation (if point 16 and 17 not met)

**Information:**

- Determine pump sizes on site
- Define pipe sizes of primary circuit on site, for instance with 6 K spread and compliance with the pump characteristic curve
- Define pipe dimensions of secondary circuit on site, for instance 6 K spread
- Provide an overflow in the secondary circuit.
- Provide valves for hydraulic balancing
- Protect pipes in areas exposed to frost from freezing (glycol)
- Insulate pipes and components in the cooling circuit with a vapour diffusion layer against condensation
- Check and ensure the external pressure of the chiller pump

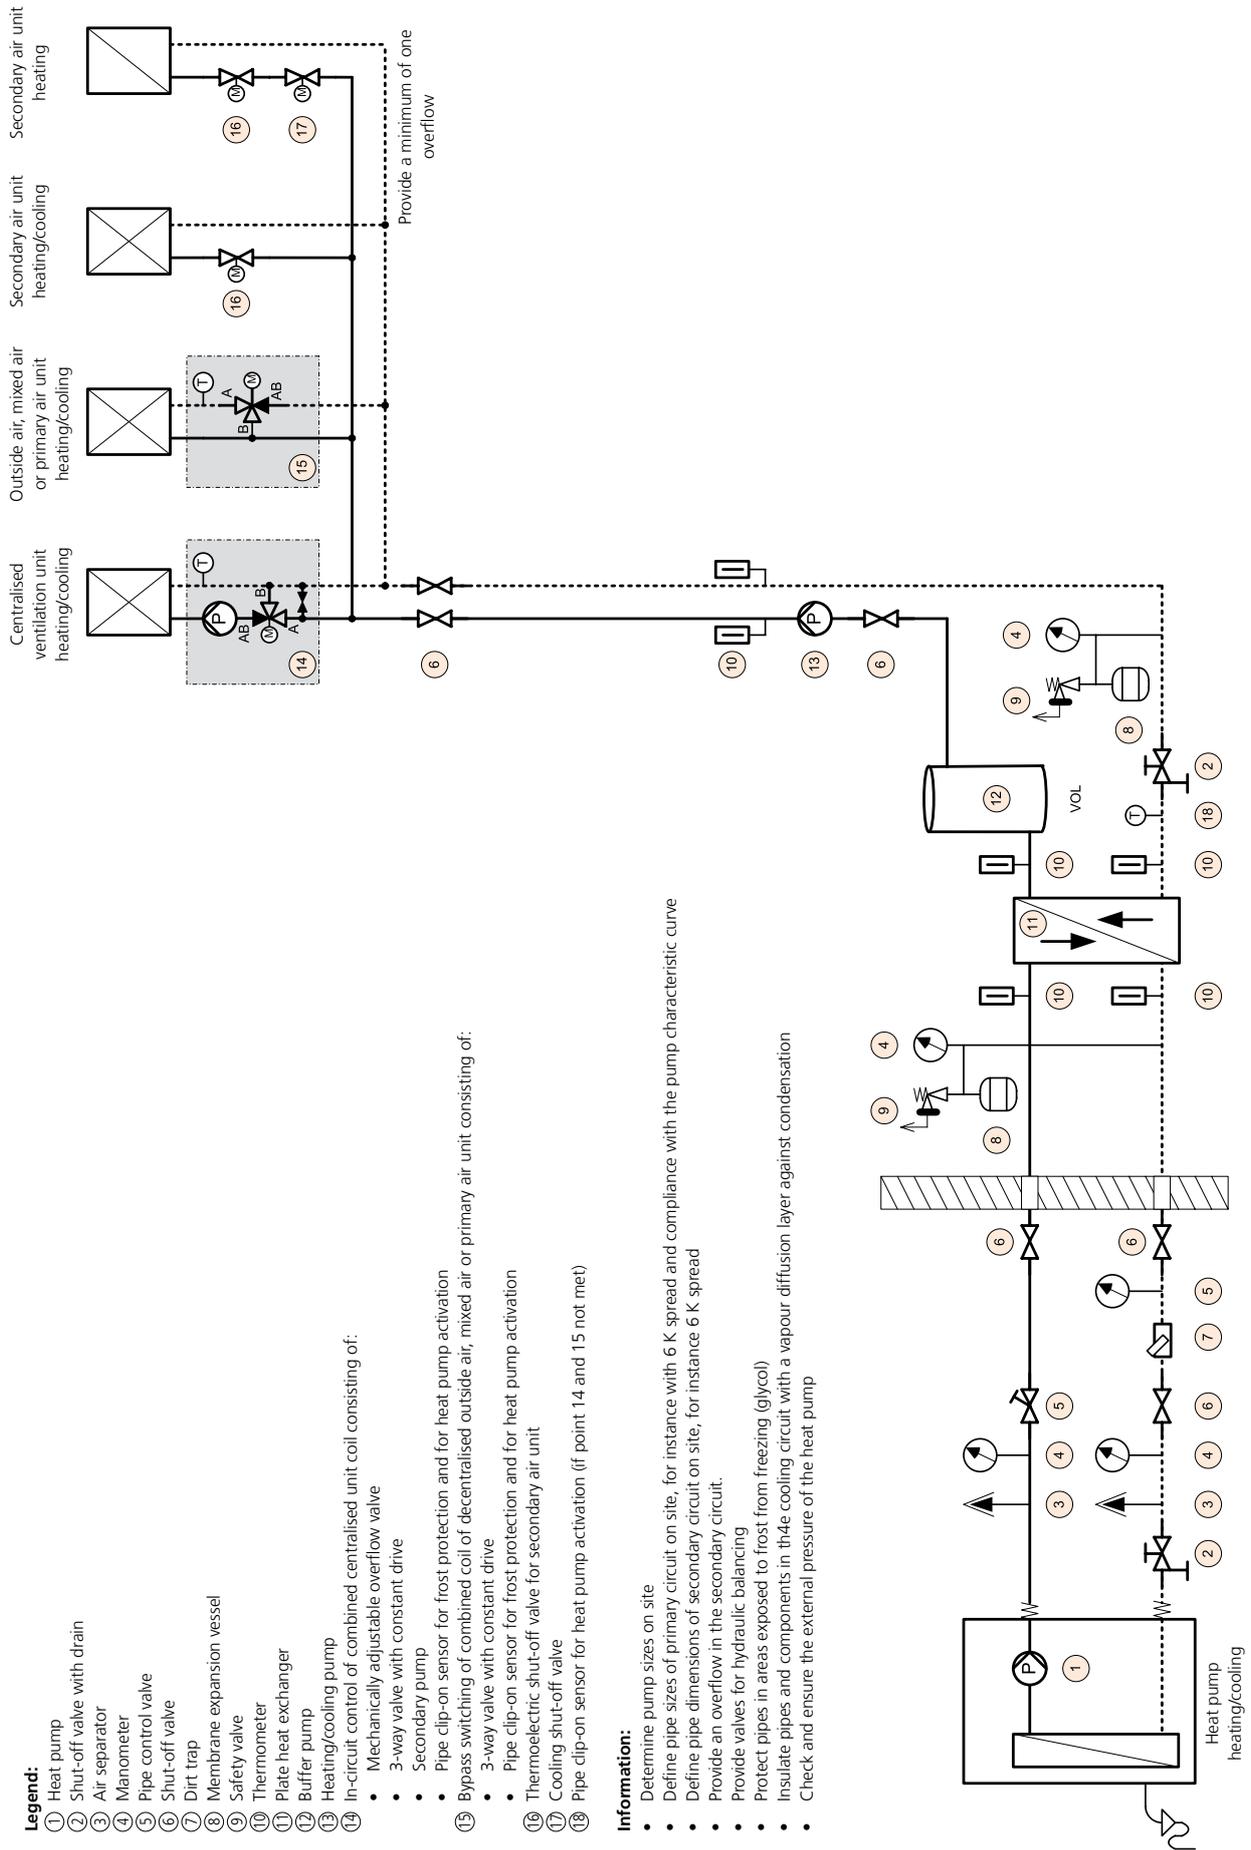

## Hydraulic system 4: 2-pipe, heating/cooling, monovalent heat pump

### Legend:

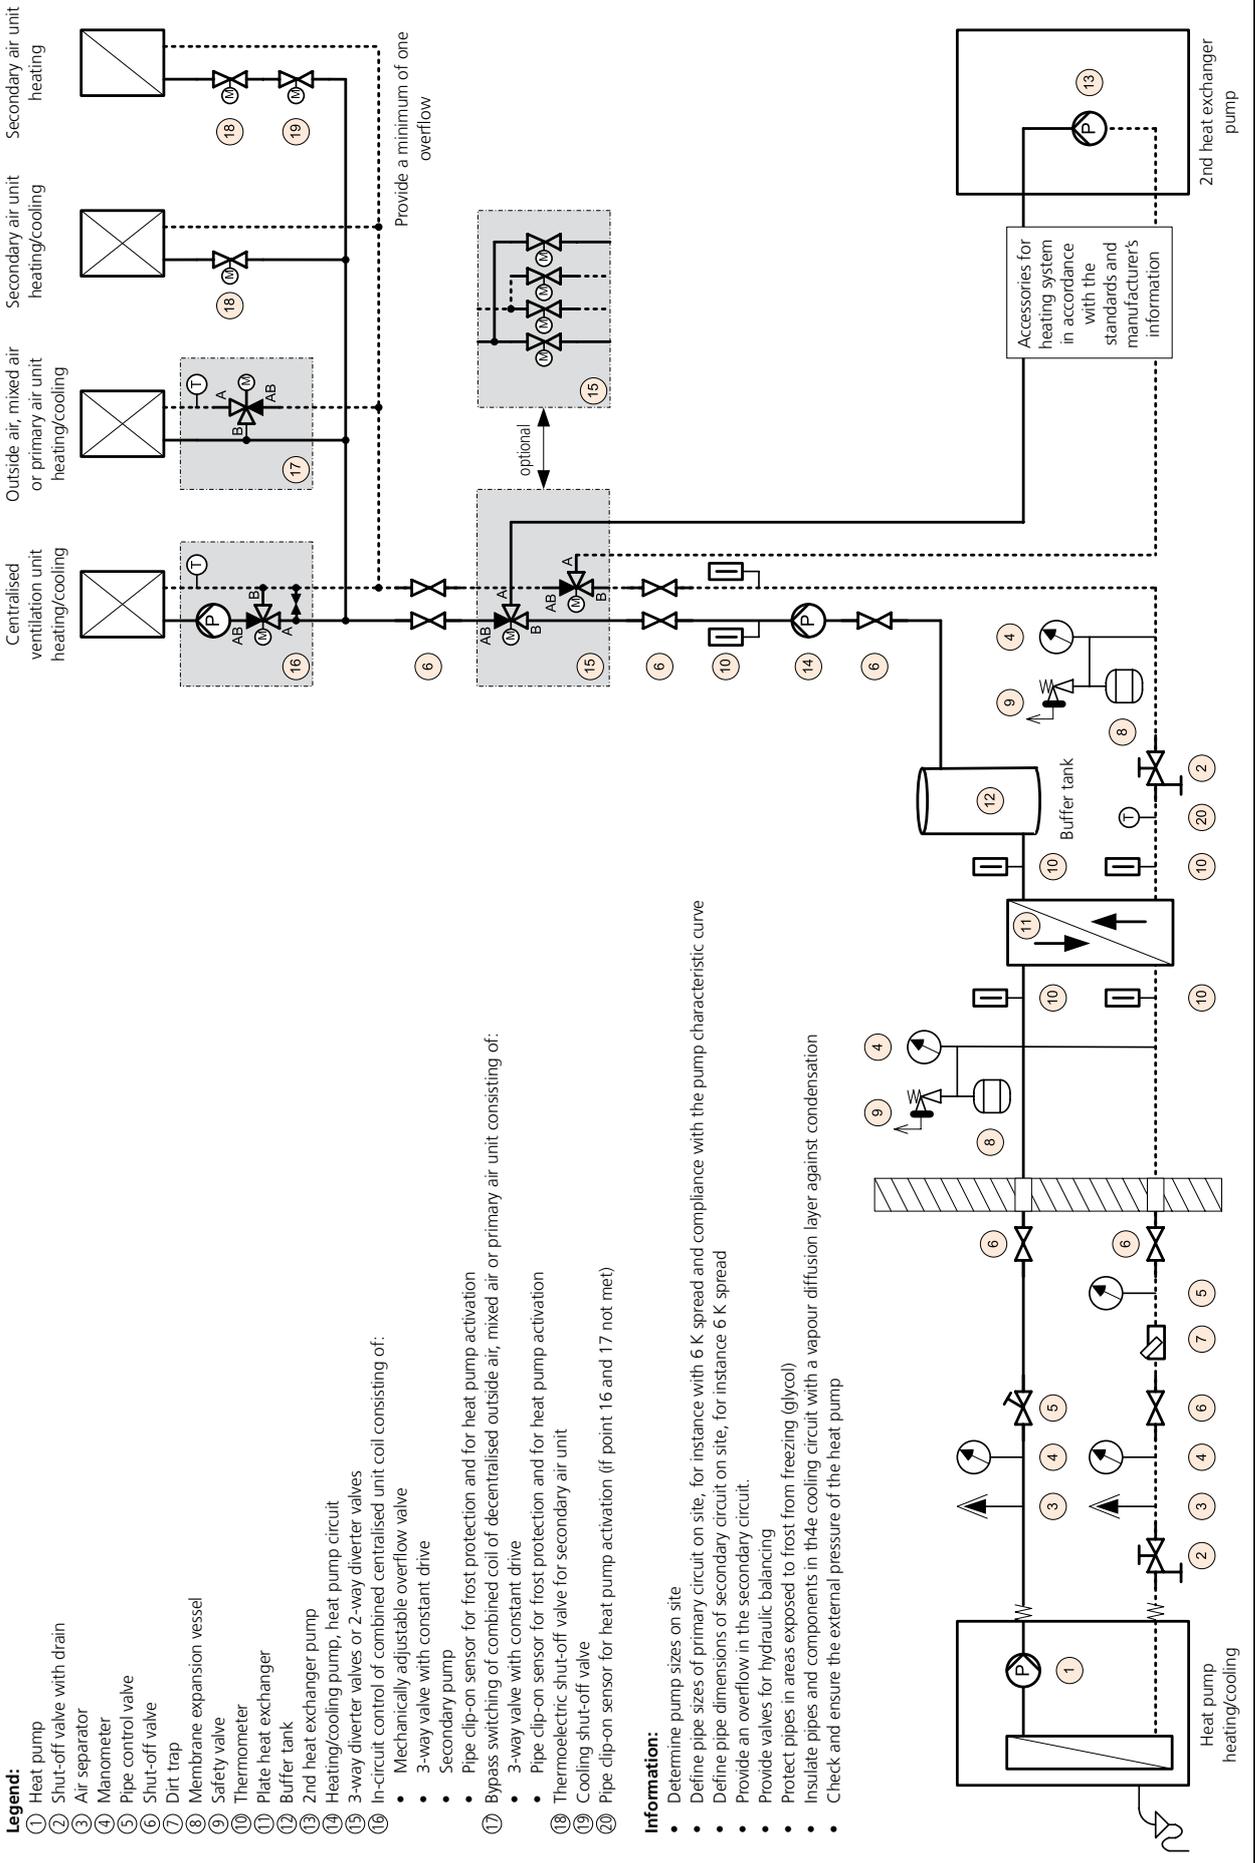

- 1 Heat pump
- 2 Shut-off valve with drain
- 3 Air separator
- 4 Manometer
- 5 Pipe control valve
- 6 Shut-off valve
- 7 Dirt trap
- 8 Membrane expansion vessel
- 9 Safety valve
- 10 Thermometer
- 11 Plate heat exchanger
- 12 Buffer pump
- 13 Heating/cooling pump
- 14 In-circuit control of combined centralised unit coil consisting of:
  - Mechanically adjustable overflow valve
  - 3-way valve with constant drive
  - Secondary pump
  - Pipe clip-on sensor for frost protection and for heat pump activation
- 15 Bypass switching of combined coil of decentralised outside air, mixed air or primary air unit consisting of:
  - 3-way valve with constant drive
  - Pipe clip-on sensor for frost protection and for heat pump activation
- 16 Thermoelectric shut-off valve for secondary air unit
- 17 Cooling shut-off valve
- 18 Pipe clip-on sensor for heat pump activation (if point 14 and 15 not met)

### Information:

- Determine pump sizes on site
- Define pipe sizes of primary circuit on site, for instance with 6 K spread and compliance with the pump characteristic curve
- Define pipe dimensions of secondary circuit on site, for instance 6 K spread
- Provide an overflow in the secondary circuit.
- Provide valves for hydraulic balancing
- Protect pipes in areas exposed to frost from freezing (glycol)
- Insulate pipes and components in the cooling circuit with a vapour diffusion layer against condensation
- Check and ensure the external pressure of the heat pump

### Hydraulic system 5: 2-pipe, heating/cooling, bivalent heat pump alternatively via 2nd heat exchanger

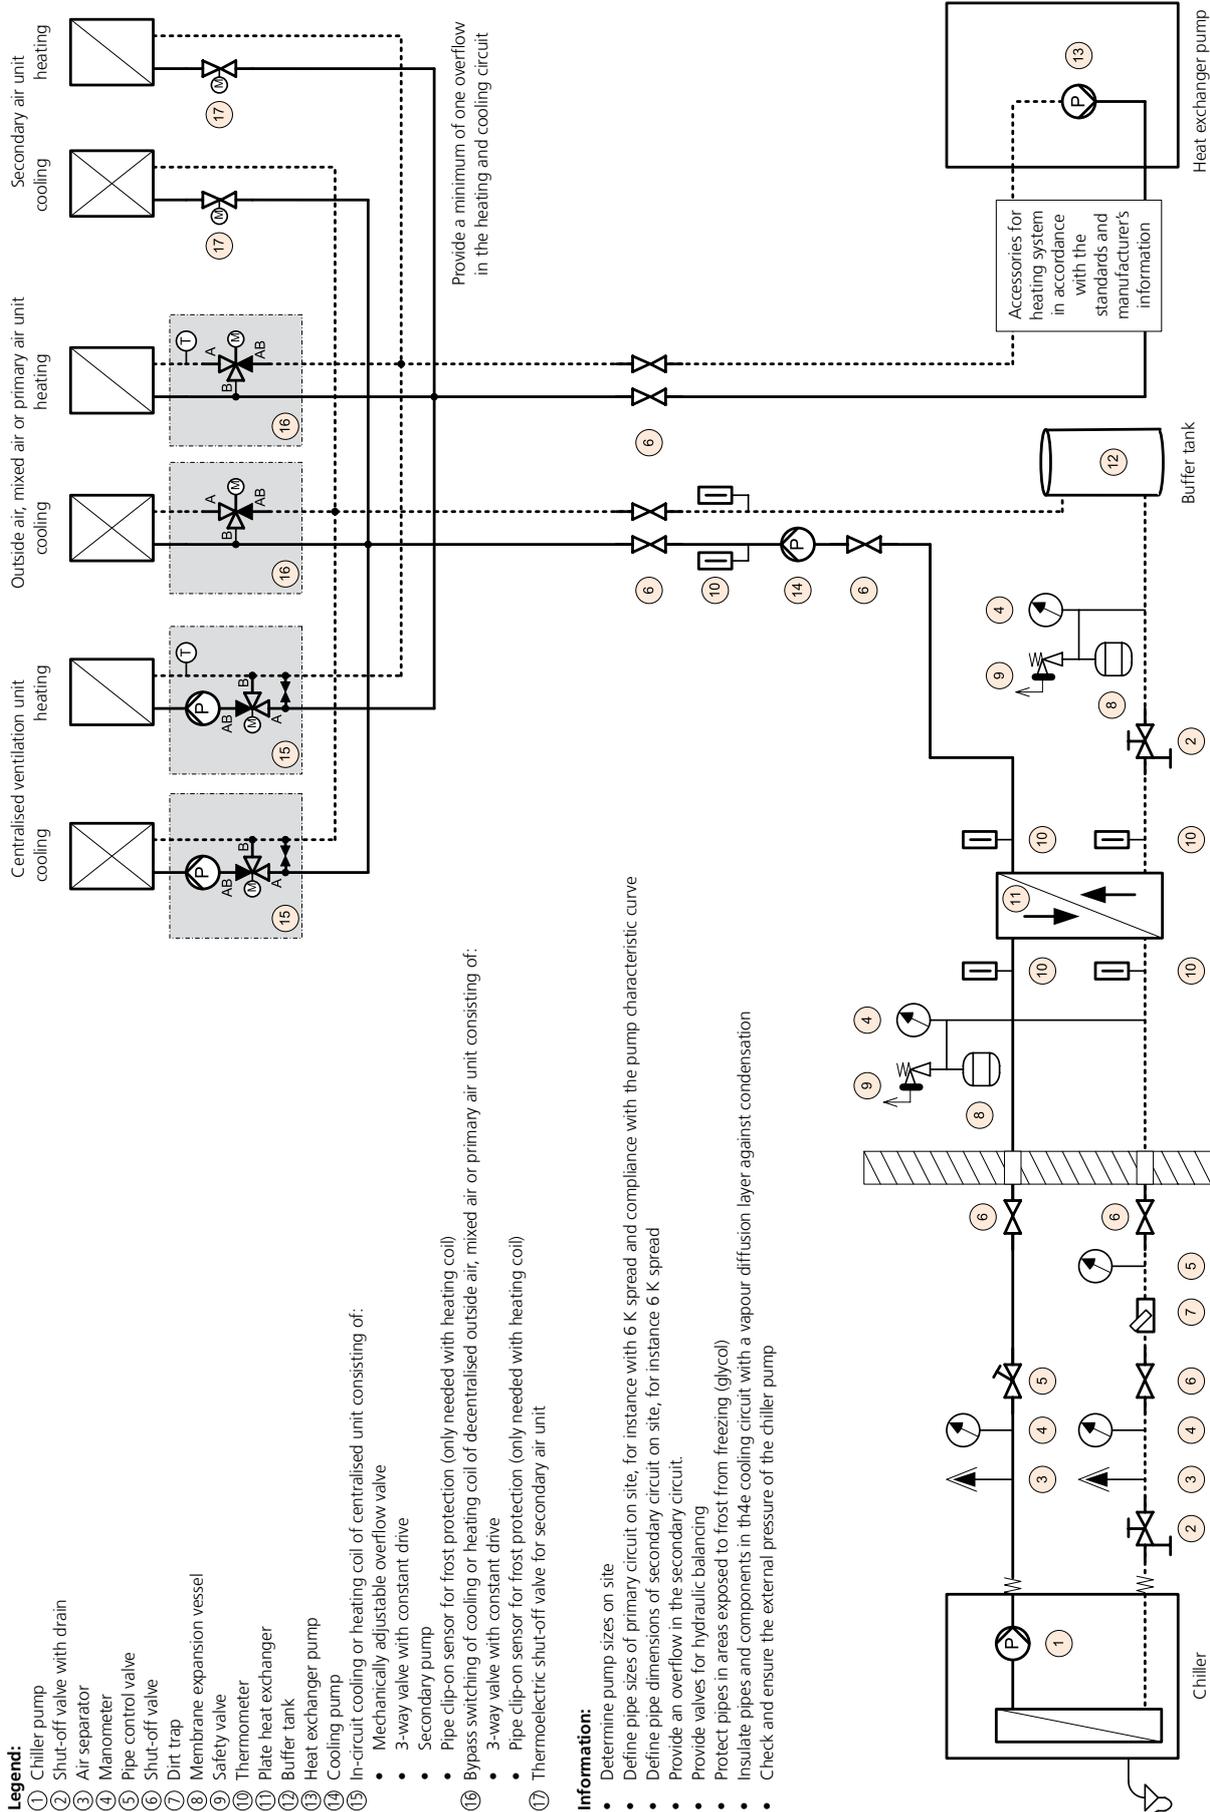

**Legend:**

- 1 Heat pump
- 2 Shut-off valve with drain
- 3 Air separator
- 4 Manometer
- 5 Pipe control valve
- 6 Shut-off valve
- 7 Dirt trap
- 8 Membrane expansion vessel
- 9 Safety valve
- 10 Thermometer
- 11 Plate heat exchanger
- 12 Buffer tank
- 13 2nd heat exchanger pump
- 14 Heating/cooling pump, heat pump circuit
- 15 3-way diverter valves or 2-way diverter valves
- 16 In-circuit control of combined centralised unit coil consisting of:
  - Mechanically adjustable overflow valve
  - 3-way valve with constant drive
  - Secondary pump
  - Pipe clip-on sensor for frost protection and for heat pump activation
- 17 Bypass switching of combined coil of decentralised outside air, mixed air or primary air unit consisting of:
  - 3-way valve with constant drive
  - Pipe clip-on sensor for frost protection and for heat pump activation
- 18 Thermoelectric shut-off valve for secondary air unit
- 19 Cooling shut-off valve
- 20 Pipe clip-on sensor for heat pump activation (if point 16 and 17 not met)

**Information:**

- Determine pump sizes on site
- Define pipe sizes of primary circuit on site, for instance with 6 K spread and compliance with the pump characteristic curve
- Define pipe dimensions of secondary circuit on site, for instance 6 K spread
- Provide an overflow in the secondary circuit.
- Provide valves for hydraulic balancing
- Protect pipes in areas exposed to frost from freezing (glycol)
- Insulate pipes and components in th4e cooling circuit with a vapour diffusion layer against condensation
- Check and ensure the external pressure of the heat pump

# Hydraulic system 6: 4-pipe, heating and cooling in succession

**Legend:**

- 1 Chiller pump
- 2 Shut-off valve with drain
- 3 Air separator
- 4 Manometer
- 5 Pipe control valve
- 6 Shut-off valve
- 7 Dirt trap
- 8 Membrane expansion vessel
- 9 Safety valve
- 10 Thermometer
- 11 Plate heat exchanger
- 12 Buffer tank
- 13 Heat exchanger pump
- 14 Cooling pump
- 15 In-circuit cooling or heating coil of centralised unit consisting of:
  - Mechanically adjustable overflow valve
  - 3-way valve with constant drive
  - Secondary pump
  - Pipe clip-on sensor for frost protection (only needed with heating coil)
- 16 Bypass switching of cooling or heating coil of decentralised outside air, mixed air or primary air unit consisting of:
  - 3-way valve with constant drive
  - Pipe clip-on sensor for frost protection (only needed with heating coil)
  - Thermoelectric shut-off valve for secondary air unit

**Information:**

- Determine pump sizes on site
- Define pipe sizes of primary circuit on site, for instance with 6 K spread and compliance with the pump characteristic curve
- Define pipe dimensions of secondary circuit on site, for instance 6 K spread
- Provide an overflow in the secondary circuit.
- Provide valves for hydraulic balancing
- Protect pipes in areas exposed to frost from freezing (glycol)
- Insulate pipes and components in the cooling circuit with a vapour diffusion layer against condensation
- Check and ensure the external pressure of the chiller pump

## Use of glycol

### Use of glycol for frost protection

Chillers and heat pumps are often filled with a water/glycol mixture for frost protection. Note the following general points to avoid problems in operation and damage:

- ▶ The performance of the chiller or consumers is reduced by the thermodynamic properties of the antifreeze agents.
- ▶ Pressure losses (in valves, pipes, heat exchangers etc.) significantly increase due to the higher kinematic viscosity.
- ▶ Pump volumes and height and valve flow rates need to be corrected and checked.
- ▶ The water/glycol mixture may be classified as hazardous to water. Put in place appropriate safety precautions to protect the environment and groundwater.
- ▶ Do not use internally galvanised pipework! The mixture dissolves the internal layer of zinc and forms films which could block components.
- ▶ The use of pure water to pressurise the system can lead to corrosion. We would therefore recommend using the glycol/water mixture for this, which is also used later.

### Correction factors

Glycol concentration	15%	20%	25%	30%	35%	40%	45%	50%
Frost protection temperature [°C]	-7	-9	-12	-16	-19	-24	-27	-30
Safety temperature [°C]	-2	-7	-10	-11	-14	-19	-22	-25
Output correction factor	0.985	0.981	0.977	0.974	0.971	0.968	0.965	0.962
Consumption power correction factor	0.990	0.988	0.986	0.984	0.982	0.981	0.979	0.976
External pressure correction factor	0.990	0.980	0.970	0.960	0.950	0.940	0.93	0.92

### Normal antifreeze

Antifreeze	Ethylene glycol	Propylene glycol
Applications	Suitable for frost protection in cooling and heat pump systems with the exception of food and beverage areas	Suitable for frost protection in cooling and heat pump systems in food and beverage areas
Product description	Brightly coloured yellow	Light blue coloured
Water hazard class	1	1
Possible product	Antifrogen N	Antifrogen L
